BB TOKEN

BIG BROTHERS

Introduction

Big Brothers Co., Ltd. Is a company of people with the same big goal.

We prioritize customer business value creation through creative and systematic procures, and provide various benefits also rewards to users as a user-based platform.

In line with the trend of rapidly growing virtual asset platform business these days. “Big Brothers” planned a BB Project that links block-chain and NFT technologies with platforms that can be used in real life.

Expertise

The BB Project which connects with various industries, has developed virtual assets with the goal of becoming the best business. This will be an integrated payment method that can be used online/offline or points, mileage, etc.

These services include interconnection of various industries, flexible development for platform integration, block-chain based on business expansion and operation, and global community support, which can provide more benefits to users.

The contents that Big Brothers will carry out strategic collaboration and business expansion are as follows..

BB Platform Ecosystem

Big Brothers is developing and operating various platforms through the virtual asset business, as well as new users and virtual asset business. We plan to form a diverse and fresh ecosystem as a major axis.

1. BB Ecosystem

Various Benefits

- In conjunction with on/offline partners, provide users with various benefits and uses of BB token (discount, airdrop, marketing reward)
- Partners share BB holders and provide low payment fees and vendors with BB tokens

NFT Linked Business

- Real products and assets are NFTized and applied to enable customers to engage in economic activities
- Offer special benefits and rewards to buyers
- Possess a business agreement possible when conducting business

BB Platform Ecosystem

2. Diversification of token-enabled platforms

- Accommodation platform
- Travel platform
- Shopping platform
- Delivery platform
- Sharing platform
- Leisure platform
- Medical platform
- Legal platform
- Entertainment
- Interior platform

BB Token Project outline

While digital currency-related institutions and fintech companies in each Asian country maintain their own systems, mutual payments through payment alliances

Wouldn't it be great if the system could be used? Our BB project started with the dream of,

It is the beginning of the 4th fintech industrial revolution to be tied together.

The BIG Brothers Project (hereinafter referred to as the “BB Project”) is a next-generation hybrid blockchain developed by Big Brothers.

Continuous service by planning platform and focusing on blockchain technology and commercialized payment technology with technology partner company SCC.

It is designed with field scalability.

Currently, the world's simple payment market is an agglomeration of the fintech industry, but fair information compatibility due to the central control method with absolute power and security transparency limits and deepening unnecessary waste. This is a leak of personal information to consumers.

and security concerns, avoiding changes in payment habits, limiting payment infrastructure, and imposing high fees on merchants along with various regulations

This has resulted in unavoidable consequences.

The BB project is based on a utility method that can be used as a payment virtual asset in member companies' merchant infrastructure.

However, we may provide some of our profits to special contract buyers (limited to the initial number of people and conditions), but if the conditions are not met,

This project proceeds without a special contractor.

BB Token (hereinafter referred to as BB) is a global service that expands services in the fields of tourism, travel, leisure, and lifestyle.

It is a project, and it is a platform that puts user benefits first by using blockchain technology in real life.

Korean tourism, accommodation,

Various companies such as airlines and shopping will be with BB as service partners, and

Companies will join as participating members of this project.

BB is a free transaction means of digital currency of service partner companies that have joined the platform as the key currency of the E-ecosystem.

will be utilized. As a real-life project that will change into a new lifestyle centered on digital currency, each field

Digital currencies such as coins, tokens, points, gift certificates, coupons, and mileage of alliance partners (hereinafter referred to as coins, tokens, points, mileage, etc.)

Collectively, the BB project that can be used for necessary services by collecting digital currency Available. BB is used as a means of integration, purchase, and cash flow in the trading market. BB from a utility point of view

It is used as a virtual asset of the business unfolding as a project so that users with BB can receive practical benefits.

From an investment point of view, the value of BB will continue to rise along with business growth.

Fintech

"Fintech" refers to a service that combines 'Finance' and 'Technology' or a company that provides such a service pointing to it. And the technology we are talking about here is information technology.

Four areas of Fintech

Payment settlement

This is the field most financial consumers are familiar with. A variety of payment services are available, from hardware-based to app-based, and provide easy and convenient services for users in online and mobile environments. It connects users who need payment services with operators and receives commissions.

Financial data analysis

The existing financial data analysis task was to calculate the appropriate interest rate by identifying the creditworthiness of the customer based on the financial transaction, but the hybrid blockchain fintech uses big data and small data to quickly analyze a wide range of information and provide customized service according to the user's needs. We are making breakthroughs in various fields to meet the needs of various consumers by providing

Financial software

Hybrid blockchain software that makes financial operations more efficient includes making risk management, accounting, fraud detection (FDS) operations more efficient.

Hybrid Blockchain platform

This project is that provides a foundation for customers around the world to freely process financial affairs. You can borrow money from customers and lend that money back to many customers. Investment raising and loan application and execution can all be processed on the online platform; you can eliminate the huge expenses incurred by operating an offline branch. In addition, data can be used at a lower cost to more precisely evaluate customer creditworthiness and lower loan interest rates than traditional financial institutions.

With customer consent, financial asset information scattered across multiple financial institutions can be collected and managed in one place, and overseas remittance fees can be dramatically reduced.

countries such as Korea, China, Japan, Saudi Arabia, Indonesia, Vietnam, Philippines, Singapore, Malaysia, Thailand, New Zealand, Australia, and Russia, and It is a hybrid blockchain smart system that enables mutual payment without significantly changing infrastructure.

It is possible to pay with digital currency in various public transportation payment areas and online and offline payment areas (shopping malls, internet shopping malls, distribution stores, restaurants, tourist destinations, etc.) with card and smart phone electronic wallet app, NFC function, and QR code function. Payment-related companies such as prepaid card companies, e-wallet companies, and fintech companies in Asian countries will enter into an alliance agreement, and use interchangeably in digital currency payment areas in many fields, such as distribution, finance, and transportation, to acquire a wide range of convenience. You can make a profit.

We will plan, develop, and operate digital currency of the alliance with BB so that it can be used as a transaction payment method according to the decision (POS) of the alliance members through the digital currency of the block chain technology so that the digital currency of the alliance with BB can be compatible.

The BB project mainly engages in “three-way payment in its own currency” at the same time as promoting the Asian payment alliance. Members of the Asian Payment Union will jointly develop fintech technology and mutually deposit payment amounts, and will be able to partially, selectively, and consensually share the payment infrastructure, members, and data of each member company. For members of the Asian Payment Union, the new infrastructure and member DB are limited, selective, and flexibly shared opportunities, which will generate additional revenue. A number of direct and indirect benefits are given to members of the payment union member companies.

It will become the center of the fintech industry in each Asian country, and through this, it will become a BB project that connects and develops telecommunications, finance, IT industry, and tourism industry.

BB brief overview

- **Integrated management / Use of digital currency**
Coins, tokens, mileage, points, coupons, gift certificates, etc. can be integrated into the platform and used immediately
- **Offer discounts to users**
Discounts under affiliate services and agreements
- **User sharing**
User sharing among affiliate service companies within the platform
- **Global partnership**
Alliances between companies around the world using the global infrastructure of blockchain
- **Metaverse platform**
All partner spaces and contents of the BB platform can be experienced in the BB WORLD metaverse world
- **BB NFT**
BB NFT Provides profit and economic activity to holders by turning real assets into NFTs
- **Reward for Contribution**
Rewards for BB Platform Users
- **Transparency and reliability of data**
Impossible for forgery of data with blockchain technology

Problems (reality)

Most of the risks in the simple payment industry are security and consumer protection, and conflicts of interest between stakeholders, which are exposed to the simple payment service market, which is never easy for consumers and merchants to enjoy their rights. The BB project seeks to solve these problems and will develop in a positive direction in projects based on the use of blockchain technology.

Through the BB project, we will expand our business more actively so that more users can share and benefit from the new hybrid blockchain fintech platform.

- Partial, selective, and consensus sharing of DB of Fintech Alliance user transactions
- One-stop smart service through integrated management of local and global transactions
- Reduce human infrastructure and offline management costs by simplifying the transaction process
- Fair distribution of additional revenue resulting from cost savings
- Realize benefits to holders and franchisees, such as low fees and convenient benefits
- Fair and transparent compensation according to user's contribution
- Securing transparency and safety for user transactions and information DB management
- Promote continuous globalization

BB Solution

The BB project system will develop a simple payment service into a blockchain solution. In easy payment, the principal is transferred from the consumer to the service provider. The service server system performs the authentication, verification, and verification procedures that the client, that is, the user did so far, and lets the Fraud Detection System (FDS) do the systematic verification of whether the user is using the service properly.

Overall, a centrally controlled platform can secure a competitive edge in time and service price through a big data analysis system, but a business strategy that introduces new technology provides customers with a fundamentally new way to interact with the simple payment market.

01 Digital asset linkage service

We will implement a solution that provides existing pay services (payment, remittance, payback, etc.) in conjunction with various existing digital assets. This will allow digital assets that remain with significant singular trades and limited utilization values to be used as real currencies. Ultimately, it is possible to build a cashless global ecosystem, and by providing transparent and mutually compatible services in the form of sharing and transacting only with specific people, it avoids bottlenecks that occur in illegal money transactions and helps rational asset management.

02 Minimize merchant fees and send money in the shortest time

In the expansion of the Net (merchant stores), which is essential for the spread of users, we minimize the cost of introducing new devices for the payment system, as well as the subscription and management fees for alliances. In accordance with the principle of cost reduction, the payment amount is paid in the shortest amount of time, deducting the fee. Because we know that the spread of Net around the world means the spread, support and satisfaction of loyal consumers of BB project.

03 Security

Reinforcing security is the most important part for easy payment consumers. Since the BB project was concerned about security from the beginning, it is called a public transaction ledger and applied the blockchain method (POR), a technology that prevents hacking when trading with virtual assets. This means that BB provides its own utility services to users by linking with virtual assets around the world.

04 Third-party payment systems

The existing third-party payment system refers to an electronic wallet system that is used to purchase and pay for products in e-commerce web services by registering an individual's bank account or credit card in the system account. The BB project will also serve as a third-party payment system, strategically working with virtual asset exchanges and other payment service companies.

BB WALLET

Mobile electronic wallet is called 'e-Wallet' or 'Digital Wallet'

It is a kind of electronic payment system used in e-commerce. Unlike smart cards, which are IC-type electronic money, it refers to software that stores money values in a PC hard disk or virtual bank account and uses it as a wallet while paying for e-commerce transactions.

The electronic wallet makes payments online, encrypts information about it, and provides payment guarantees and purchase transaction functions for e-commerce (EC) users.

When this system is established, when purchasing goods or services through the Internet site of an agreed upon company, consumers can use their registered card number or eliminates the inconvenience of having to enter all specific information because purchases are made immediately by ID verification, etc. Currently, as smartphones become popular, they are also used as one of the electronic payment systems that are carried out on mobile.

Digital currency is an online payment method that converts the properties of existing money into electronic information (international web payment system) instead of money. Unlike cyber money, which has limited usage restrictions, it is a currency used around the world, and can be circulated in cash through virtual asset exchanges, personal/debit cards, and QR codes in each country.

Network type digital currency

Used for PC storage type commerce

IC card type digital currency

Issuing an IC card linked to your account at a financial institution, a prepaid card in the form of a recharge

QR code type digital currency

Generate and issue a QR code linked to your account at a financial institution

Need for a mobile e-wallet

Customer/ Member

- Convenience/variety of purchasing/using methods (providing ease of use)
- Inflow of potential customers through sales / promotions
- Attracting corporate customers through customers and partnerships
- Loyalty customers can be secured through membership

Sales/Profit Creation

- Sales / Promotion - Profit creation
- Securing cash from sales of future products (reserved funds) by selling digital assets
- Expected sales shift effect
- Unrecovered exit revenue (fallout)

Management /Operation Convenience

- Internet and network-based management and operation
- Reduction of operating manpower cost compared to WEB – solution introduction and consignment management possible
- Member management (during sales and operation) – securing and utilizing loyal customers

Promotion/ SYNERGY effect

- Utilize customer DB and actively utilize promotions.
- Expected 1:1 targeted promotional effect
- Image stock

Starting point

The BB planning team conducted market research with a focus on the Korean market and selected Korea as a starting point compared to other countries and regions based on market capacity, legal issues, operating costs, infrastructure and available expertise. Also, starting in Korea, we can plan to serve the Asian Easy Payment market for the following reasons.

Market exports

The simple payment industry in Asia Pacific countries moves with smartphone penetration. BB, which is using the QR code method and prepaid card service without hesitation in its initial market entry, will be a good starting point.

No dedicated license

The QR code itself opens a license so anyone can use and apply it for free. If you access the web using a QR code, you only incur instantaneous data communication fees (1/10), so you can avoid additional costs, find customers for beta testing, and establish yourself in the market within strict deadlines. In addition, we operate business in the market using existing prepaid cards.

IT infrastructure development

The payment service has already been verified through several actual commercial tests, and a data collection system for simple payment has been introduced. As a result, developers will be able to implement universal simple payment app-based tracking through the record of transfer of ownership on the blockchain.

Definition and Use

BB is an innovative financial system to overcome physical and time limitations and unnecessary fee systems in cross-border, business-to-business, and personal transactions, and is evolving into a more intuitive, user-oriented global digital asset. It is an integrated platform that provides convenience for foreign exchange transactions between countries, payment system for business operators, and efficient financial services between individuals. / We aim for digital currency as a means of integrated payment in offline. The configuration is a currency method according to financial services, an integrated digital asset payment method, and an electronic wallet based on web/PC/mobile devices for exchanges and services, points, messengers, and an automated distribution system according to payment fees .

Electronic wallet

Payment through digital currency on mobile and web
There is no time and space limitation, and global service is possible in the future
Free payment service
ON / OFF Line payment service with QR code, card and app
Fintech service provided on app and web
Integrated management service as a link service with point-related companies
Real-time usage history and accumulated contents confirmation service
Provision of earning service upon use

Virtual asset compatibility

Compatibility between agreed digital currencies
Complementing the existing system and modifying the program by the blockchain algorithm
Change the program in the form of an electronic wallet instead of a virtual account

BB core technology

POR(Proof of Random)

With the technology that BB is preparing, only master nodes have exclusive rights and power in the existing method, whereas in the blockchain platform that BB is preparing, which nodes will participate in block generation at random, the authority of the master nodes is obtained. will grant

This can be an equal opportunity for all nodes, and serves as a strong defense against hacking as the target of the selected node cannot be specified.

The PoR (Proof of Random) method is designed to overcome the slowdown caused by node expansion, which made it impossible to use in real transactions, and to generate blocks in real time no matter how many nodes participate.

BB Core Technology

SMART SELECTION & DROP

BB Core Technology

SMART DIFFICULTY (Strong security function to prevent hacking)

With the technology being prepared by BB, the difficulty is adjusted differently depending on the transaction amount, so blocks are created quickly and easily for low transactions, and the difficulty increases accordingly as the amount increases.

During the block verification time, it is controlled by verifying whether the transaction is normal or not.

Integrated platform

Platform's virtuous cycle ecosystem function

The platform is a hybrid system that performs fast and safe distribution with minimal power. All users can be rewarded with tokens through productive activities and can conveniently use them for payment, etc. in their daily life.

After a certain period of time, if the balance of circulation and money supply becomes the same, the hybrid system will naturally disappear, and ultimately, a permanent and independently circulating ecosystem system will be realized without any external intervention.

BB NFT Platform

NFT, Electronic wallet, market development technology

BB is preparing to establish its own NFT market and can be used as a means as a virtual asset to trade NFTs, and also as a derivative of BB We are planning a BB NFT. NFT (Non-Fungible Token) means 'non-fungible token', and the ownership of assets. It is a means of converting the tokens into unique tokens so that they have the same rights and qualifications as if they were owned in kind. Accessibility and management convenience are high in a wide range from small to large amounts, and in simple terms, it can be called a "digital certificate of ownership".

The advantage of NFT is that when a unique token is assigned to an asset, the transaction history remains in the record, making it impossible to forge & falsify, and it is easy to track and securitizes in-kind assets based on trust. Available. In particular, partial ownership is recognized and can be traded like 1/n.

In general, real estate transactions such as real estate and artworks are time-consuming and costly as many stakeholders and documents are involved. It is possible to block and manage false items and false information that disturb the real estate transaction order.

When NFT tokens are issued and traded as collateral for real assets, BB will be used as a transaction tool, and the NFT market established by BB will grow into a specialized NFT market for securitization of tangible and intangible real assets. In this regard, we will cooperate with related professional companies and law firms, and will develop into an international NFT brokerage platform for domestic and foreign investors.

BB NFT WORLD

BB WORLD

BB WORLD NFT Main Features

1. NFT linked to real assets provided by the BB platform
- 2 . NFTs can be stored on devices and marketplaces
3. Possible to configure various real-life contract products such as hotel accommodation vouchers, golf vouchers, limited fashion products, and bio products
4. Induce the inflow of existing NFT holders by partnering with major domestic NFT projects

BB NFT Category

BB NFT will present its own NFT marketplace. Starting with 5 categories, we are preparing NFTs in various fields for holders in the future.

Hotel

Hotel Accommodation Voucher
Hotel NFT
Event / Invitation ticket

Golf

Resort Voucher
Golf membership
Golf lesson
Screen golf pass

Lifestyle

Limited member
random box
dining out
voucher

Arts

BB WORLD

metaverse

Sports

global ticket
sports voucher
Specialty Supplies

Integrated platform

Integrated platform

Electronic payment

- Payment on mobile and web using virtual assets, i.e. digital currency
- There is no limit of time and space, and global service is possible in the future
- Free payment service
- All ON / OFF Line payment services with dedicated cards and QR codes

Electronic bankbook financial service

- Provides financial services such as real-time transfer, deposit, and transaction history inquiry on the app and web
- Direct use without separate ISP and accredited authentication, providing user convenience
- Real-time text service available for deposit and withdrawal
- Linking with various additional services such as earning points

earn payment

- When purchasing products, customers can earn points
- It can be accumulated with digital currency that can be transferred, withdrawn, and paid
- After payment, real-time settlement and confirmation of the earning function and accumulated contents at the same time
- Real-time available

business expansion

- Replacing point business, etc. with virtual asset business
- Complementing the existing system and modifying the program by the block chain algorithm
- Expanding the Ecosystem with the Metaverse Platform
- Linking with NFT market

BB CMS Solution

BB is developing its own CMS solution, which is being prepared, and plans to introduce a CMS solution with block chain technology. In addition, the solution will be provided free of charge to partners working with BB for 3 months, and more diverse benefits will be presented to partners with BB tokens.

BB CMS Solution

- New and effective real-time OTA management
- Unification of room price and type change
- Automate the booking process
- Added BB wallet function
- Admin custom UI interface
- Integrated management of all OTA companies
- BB Affiliate's Special Benefit (to be announced)
- Check NFT real-time information
- Metaverse Real Estate Management

BB CMS Solution Benefits

- Monthly usage fee
- Sales commission
- Other details to be revealed later

*Details of BB CMS will be uploaded to Gitbook.

BB Issued content

division	Contents	additional explanation
designation	BIG Brothers	Tourism, distribution and payment-centric tokens
mark	BB	Up to 8 decimal places in units
category	3rd generation hybrid	Aim to develop into a standalone virtual asset equipped with its own platform
Algorithmic way	POH / POR	Start with polygons, implement additional Main Net
Total issuance	2,000,000,000	Conditional fuel flow can be adjusted according to business development and system
Confirmation step	Discriminatory Verification	Adjustable speed and transaction process according to transaction amount
Mining mode	pre-mining	Pre-mining issuance and distribution method
scalability	real-time exchange	Real-time exchange available on online platforms and e-wallets
Characteristic	utility coin	A central virtual asset to the Fintech Alliance project
matrix	Distribution according to each role and member and work progress	* TokenEconomy
distribution volume	Although the BB distribution volume is adjusted according to the ecosystem creation and operation, 10% including the initial sale volume will be distributed by default. If the global ecosystem is activated, the circulation will gradually increase over the long term. Except for the initial sales volume, the actual distribution of BB may be changed by various variables such as the number of users, the number of partners involved, and the operator's policy.	

BB Token Economy

BB roadmap

* Reference

- Strategic alliances with key companies in Fintech blockchain and related fields
- Global network operation
- Continuously adding new technologies and features to the system

Member

Development Team

SCC (Smart Cryptocurrency) company is a major technology partner and aims to develop a virtual asset ecosystem and metaverse platform. In order to implement and provide unlimited use of new and innovative virtual assets, we strive to develop new changes brought about by fast-growing technologies at all levels.

Operation team

As a BB token issuance and operator, Big Brothers forms and operates a global organization around the world in the form of having an operating headquarters in Korea and headquarters and sales offices for each business in Korea and each country. Since key members who have officially participated are distributed around the world, you can have the advantage of decentralized and efficient organizational operation by contributing to the project remotely.

Advisory Committee

In order to achieve the goal of distributing new virtual assets and constructing our own virtual asset ecosystem, we are continuously learning from experts in technology, business, marketing and various fields. We are constantly learning, always asking, learning and learning from qualified people to provide end-users with services that exceed their expectations.

Marketing team

In order to promote this project to the world, marketing through various media, marketing through SNS, promotions such as forums and seminars, and marketing through business partners and partners, etc. are collectively conducted in Korea, with the marketing headquartered in Korea and specialized managers work. It's possible.

global partners and partners

This project aims to create a global network by discovering and requesting suppliers and partners around the world in all fields such as international finance, accounting, legal affairs, media, public relations, IT, fintech, and distribution.

Conclusion

One of the important functions of money is the store-of-value function, and money is supposed to move from high to low uncertainty and from high to low transaction costs. In addition, most of the existing coins have a high volatility of the price and have no way to relieve this volatility or stabilize the value, so the price is determined depending on the demand and supply in the market.

Unlike gold or other assets, there is no basic value, and the flow of income from investment is not determined. For rare reasons, prices soared or plummeted by operational forces can be seen as speculative deals. In other words, most of the virtual assets listed on the world's virtual asset exchanges, despite the excellent blockchain technology, are transformed into speculative means, and as a holder, not a user who uses virtual assets, I have it, and if the surrounding situation is disadvantageous, it is quickly sold out, and the value is controlled by the greed of the huge holders. Also, due to the possibility of using crime due to anonymity, There is always a risk of anonymous private virtual assets against policies.

As a result, private-led virtual assets are systematized for the purpose of securing and utilizing corporate funds, and the national-led virtual assets will be operated as a purpose and system to supervise to protect and protect the people's assets.

BB is a virtual asset with differentiation and central management functions created for the purpose of using the blockchain system in asset distribution and financial markets. BB, which is carried out as a cooperative system with existing institutional institutions, will be one of the major virtual assets and will be quickly established around the world.

- The goal is to become a global digital asset that can be used easily and conveniently in real life around the world.
- The goal is to utilize it in the global asset market and to be compatible with various digital currencies,
- Digital assets used in the metaverse platform and NFT market are the goals,
- The goal is to create a transparent transaction and environment.
- A new concept financial business and payment business are the goals,
- Ultimately, the goal is to be recognized in the digital asset industry and the existing system.
- Digital assets optimized for currency and trading functions in each field.

In other words, the goal of the key currency function such as payment, finance, transaction, value storage, value scale, etc.

This white paper is a basic explanation of the contents of this project, and will continue to be added and developed in various fields. I will seriously consider all questions. The additional program will be released in the additional white paper version..

BB TEAM

Indemnification Provision

This white paper is not an advice related to the sale of “BB”, nor does it recommend the proposal of the person who distributes and sells “BB”. In addition, it cannot rely on any contract or investment in all or some contents of this white paper.

- I. “BB” did not have the requirements as a securities from any judge.
- II. The white paper did not have the requirements for the plan for issuing securities, and it is not a proposal or a document that recommends investing in securities in any judge, and does not allow you to make a binding legal promise or sign a contract. Based on this white paper, we do not require virtual assets or any form of payment method.
- III. Any regulatory agency has not reviewed or approved the information contained in this white paper, and that the law, regulation, and regulations of any judicial authority have not been taken and are not taken in the future, and that it is not taken in the future, and issuing, distributing and disseminating this white paper. It does not mean that the law, regulation, and regulations are worthy.
- IV. This white paper, the beginning and completion of the ICO of “BB”, or the future, cannot be understood, interpreted or regarded as a sign that ICO is excellent.
- V. The deployment and propagation of any copy of this white paper was not sanctioned by the law, regulation, and regulations of the judicial authority in which the parties live, and where it is restricted to own this white paper, responsibility for all restrictions. Is to myself.
- VI. When you want to buy “BB”, it cannot be considered, interpreted or treated as follows:
 1. A call other than virtual assets
 2. Borrowing certificates, stocks, shares issued by individuals or institutions (including token reports), the right, options, derivatives for borrowing certificates, stocks, shares
 3. Units of group investment products (units)
 4. units of business trusts
 5. Derivatives in business trust units
 6. Other types of securities or securities
- VII. Non-accredited investors are not eligible to purchase according to national standards for pre-sale.
- VIII. Uncertainty of regulation: ICO is a chance to create standards and norms that can develop the market in the future because ICO is done in a market without regulations. However, the benefit can also be a risk. Regulators will impose more regulations on virtual assets, which may be a risk to our business.
- IX. Product Development: We have products to be introduced to the market at the time of ICO. This is different from other projects to prepare funds in the previous stage of product development. However, there will be several decisions on product development in the future, and there is a failure risk because the contents of the product are not good.
- X. At the time of entering the market: At the same time, there is a risk that the market is not ready to ask for something like a "community" service.

You are our precious partner.
With initial intention, passion
and trust will always treat you.
